# Patient Factors and Hospital Outcomes Associated With Atypical Presentation in Hospitalized Older Adults With COVID-19 During the First Surge of the Pandemic

J Gerontol A Biol Sci Med Sci, 2021

- Présentations atypiques
    - Déclin fonctionnel 25%
    - Altération des fct cognitives 11%
    - Délirium
  - Présentation atypiques associées avec
    - older age,
    - female gender,
    - Black race,
    - non-Hispanic ethnicity,
    - higher comorbidity index,
    - présence démence et diabetes mellitus.
  - Présentation typique = 1.39 times x plus de chance admission ICU.
  - Hospital outcomes
    - de mortalité,
    - de durée my de séjour,
    - de réadmission à 30-jours
- sont similaires entre présentations cliniques typiques et atypiques

## Changes in T-Cell Diversity

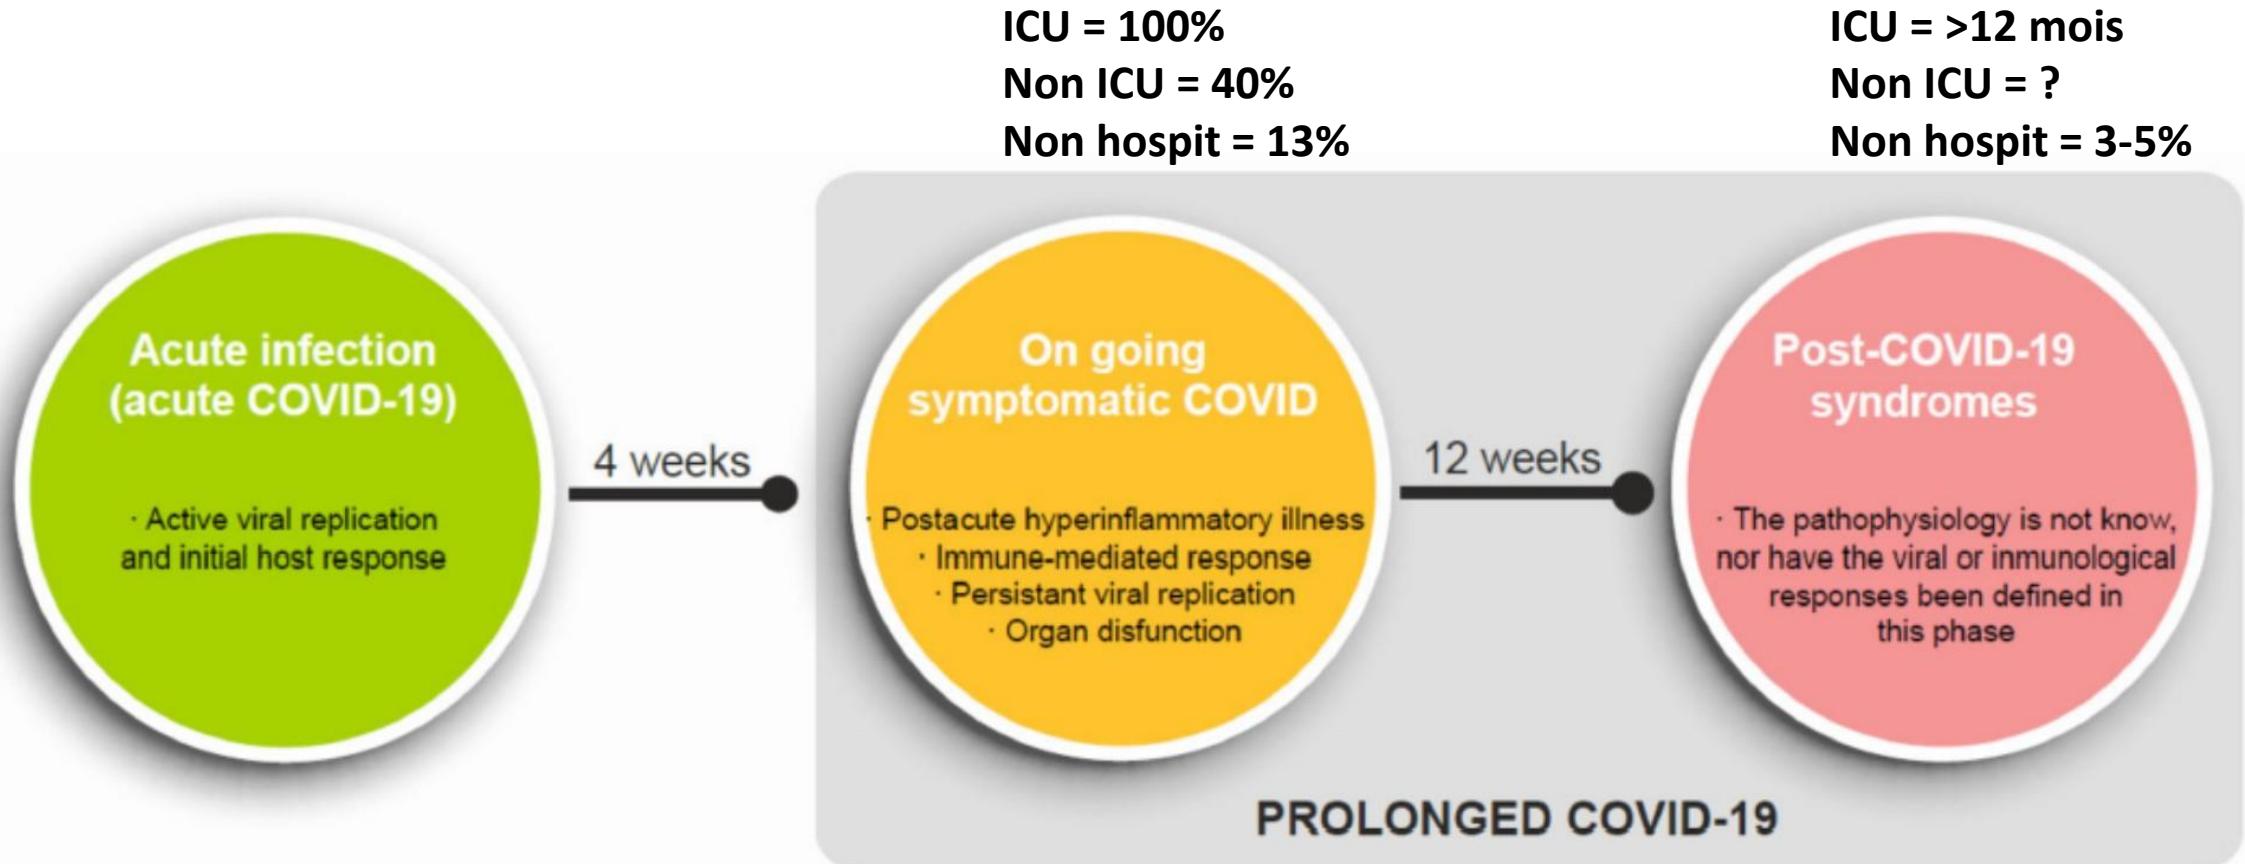

**Supplementary Table 5.** Association between hospitalization for COVID-19 and prior receipt of full vaccination with a two-dose series of a mRNA vaccine, restricted to patients without immunocompromising conditions and aged  $\geq 65$  years.

Subgroup	Vaccinated Case Patients / Total Case Patients (%)	Vaccinated Control Patients / Total Control Patients (%)	Absolute Difference (95% CI), %	Adjusted Odds Ratio (95% CI)
<b>Overall</b>	115/460 (25.0)	601/838 (71.7)	-46.7 (-51.7 to -41.7)	0.12 (0.09 to 0.16)
<b>By time between vaccine dose #2 and illness onset</b>				
14-120 days	53/398 (13.3)	472/709 (66.6)	-53.3 (-58.1 to -48.4)	0.09 (0.06 to 0.13)
>120 days	62/407 (15.2)	129/366 (35.2)	-20.0 (-26.0 to -14.0)	0.21 (0.13 to 0.32)
<b>By month of illness onset overall and by time between vaccine dose #2 and illness onset</b>				
March-June 2021 overall (Alpha period)	42/236 (17.8)	407/575 (70.8)	-53.0 (-59.1 to -46.9)	0.10 (0.06 to 0.14)
14-120 days since vaccination	39/233 (16.7)	385/553 (69.2)	-52.9 (-59.0 to -46.7)	0.09 (0.06 to 0.14)
>120 days since vaccination	3/197 (1.5)	22/190 (11.6)	-10.1 (-14.9 to -5.2)	0.13 (0.03 to 0.50)
July-August 2021 overall (Delta period)	73/224 (32.6)	194/263 (73.8)	-41.2 (-49.3 to -33.1)	0.12 (0.07 to 0.20)
14-120 days since vaccination	14/165 (8.5)	87/156 (55.8)	-47.3 (-56.2 to -38.4)	0.07 (0.03 to 0.14)
>120 days since vaccination	59/210 (28.1)	107/176 (60.8)	-32.7 (-42.1 to -23.3)	0.17 (0.10 to 0.30)
<b>By vaccine product overall and by time between vaccine dose #2 and illness onset</b>				
Pfizer-BioNTech overall	79/424 (18.6)	362/599 (60.4)	-41.8 (-47.2 to -36.4)	0.14 (0.10 to 0.19)
14-120 days since vaccination	31/376 (8.2)	280/517 (54.2)	-45.9 (-51.0 to -40.8)	0.09 (0.06 to 0.14)
>120 days since vaccination	48/393 (12.2)	82/319 (25.7)	-13.5 (-19.3 to -7.7)	0.25 (0.15 to 0.40)
Moderna overall	36/381 (9.4)	239/476 (50.2)	-40.8 (-46.1 to -35.4)	0.10 (0.07 to 0.15)
14-120 days since vaccination	22/367 (6.0)	192/429 (44.8)	-38.8 (-44.1 to -33.5)	0.09 (0.05 to 0.14)
>120 days since vaccination	14/359 (3.9)	47/284 (16.5)	-12.6 (-17.4 to -7.9)	0.13 (0.07 to 0.27)

## Attributes and predictors of long COVID

NATURE MEDICINE | VOL 27 | APRIL 2021 | 626-631 | www.nature.com/naturemedicine

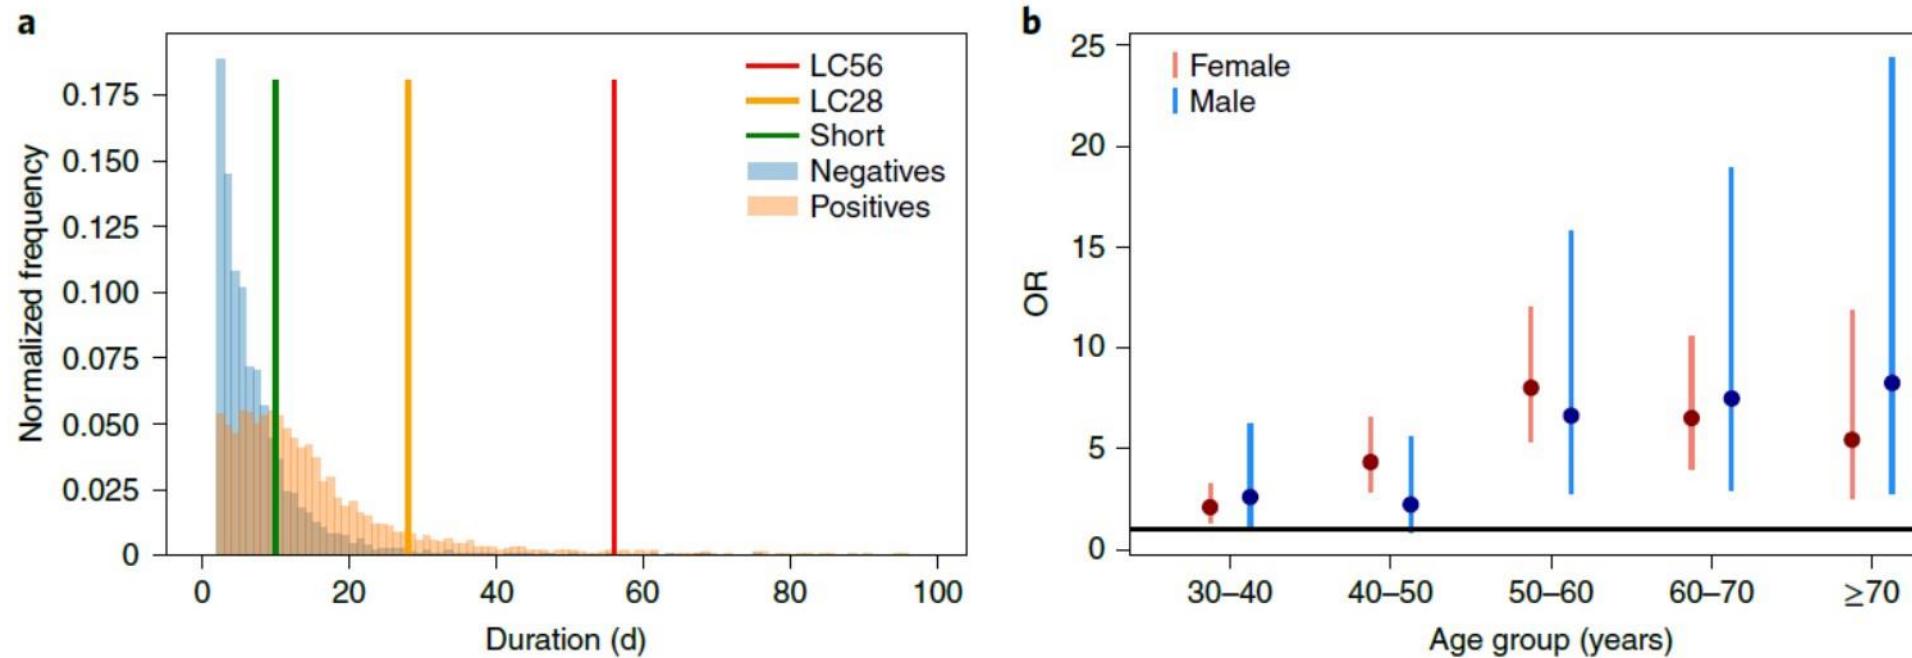

Short COVID  $\leq 10$  jours versus Long Covid  $\geq 28$  jours

N=4182 patient suivi app

LC $\geq 28$  jours => N=558 soit 13.3%

LC $\geq 56$  jours => N=189 soit 4.5%

LC $\geq 84$  jours => N= 95 soit 2.3%

**Fig. 1 | Distribution of disease duration and age effect on duration.** **a**, Distribution of symptom duration in COVID-19. The colored bars indicate the limits to define short, LC28 and LC56 disease duration. The y axis represents the normalized frequency of symptom duration; 2.4% of negative controls and 3.3% of individuals with COVID-19 reported symptoms for  $\geq 28$  d. **b**, ORs and 95% CIs of LC28 for each age decile compared to the 20- to 30-year-old age group when considering LC28 versus short COVID (1,516 females and 633 males). For males aged 20-30 years ( $n=117$ ), the proportion who had LC28 was 4.5%, compared with 5.6% of females in same age range ( $n=357$ ).

# Prédiction du covid long?

## Predictors / Risk Factors for Long-COVID

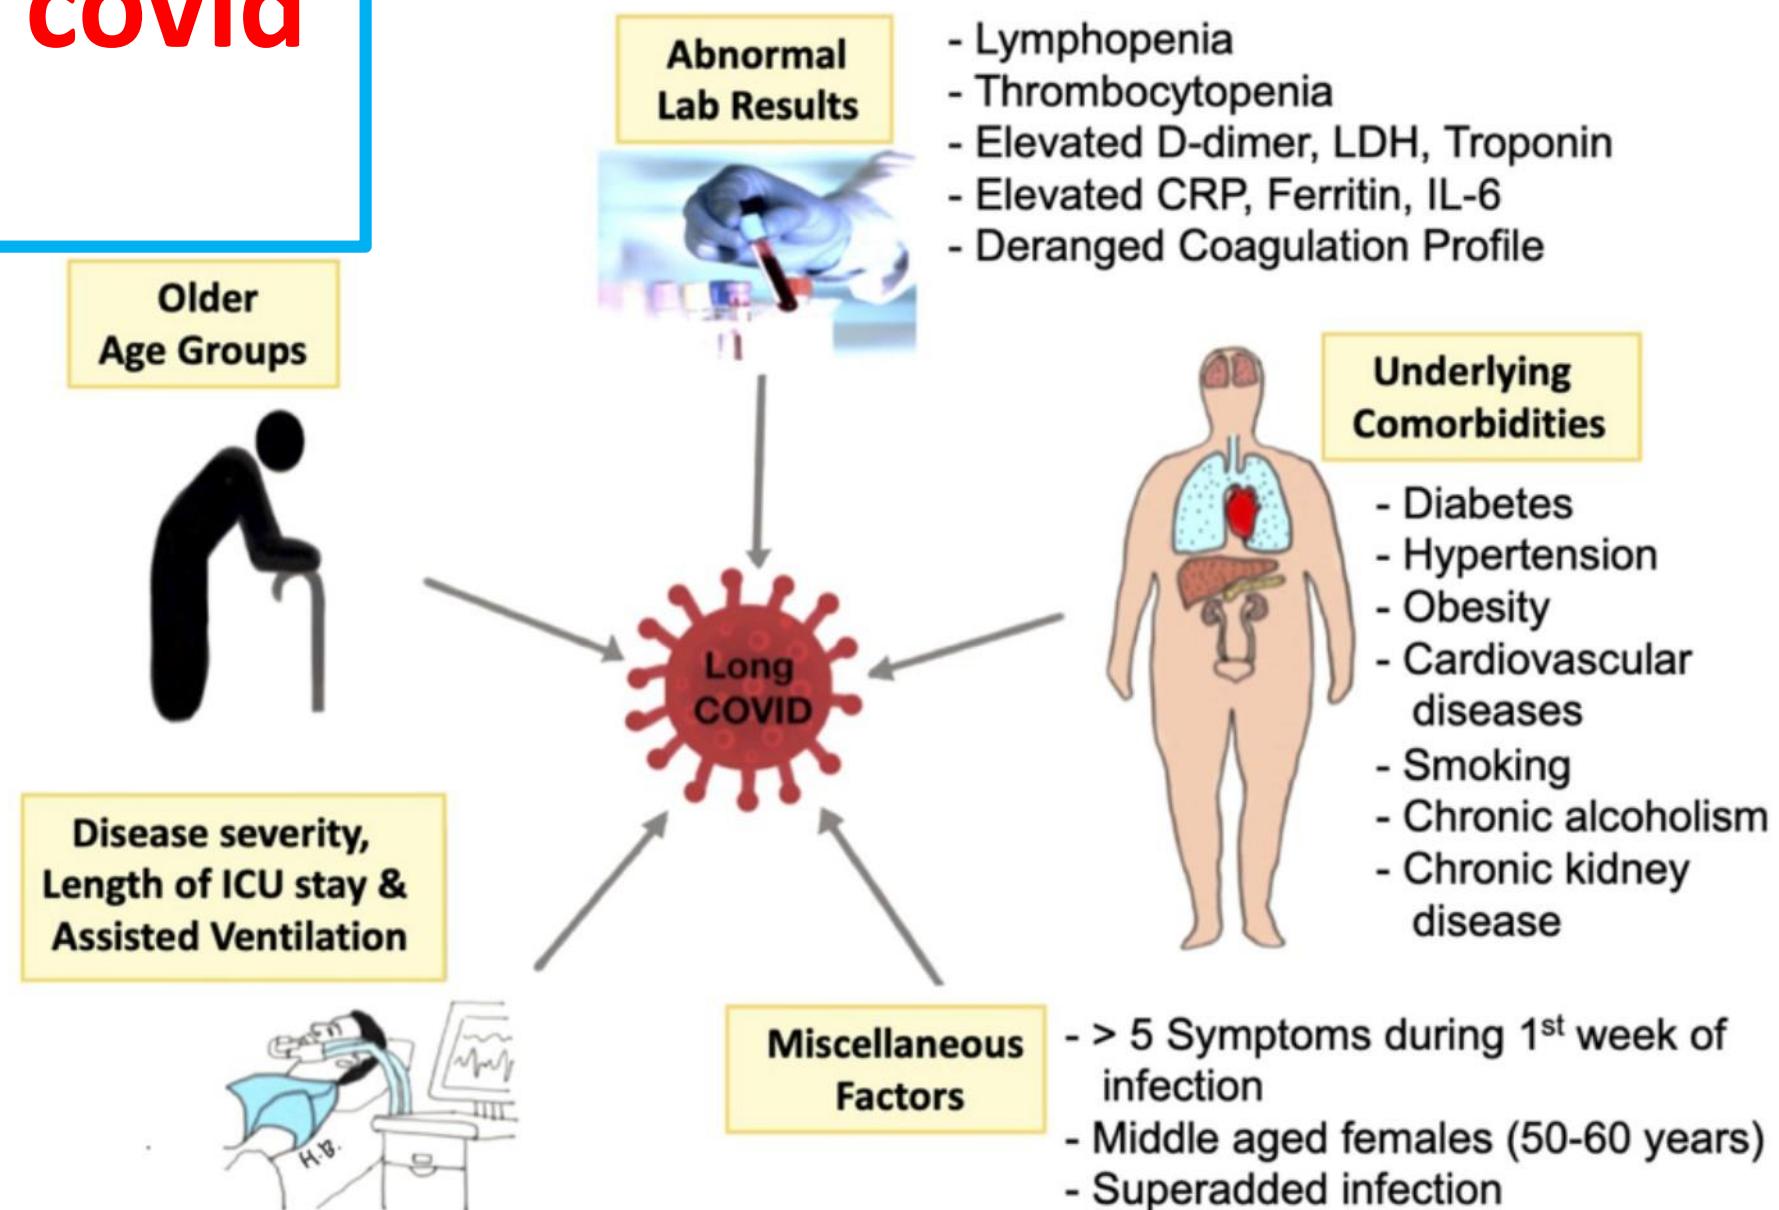

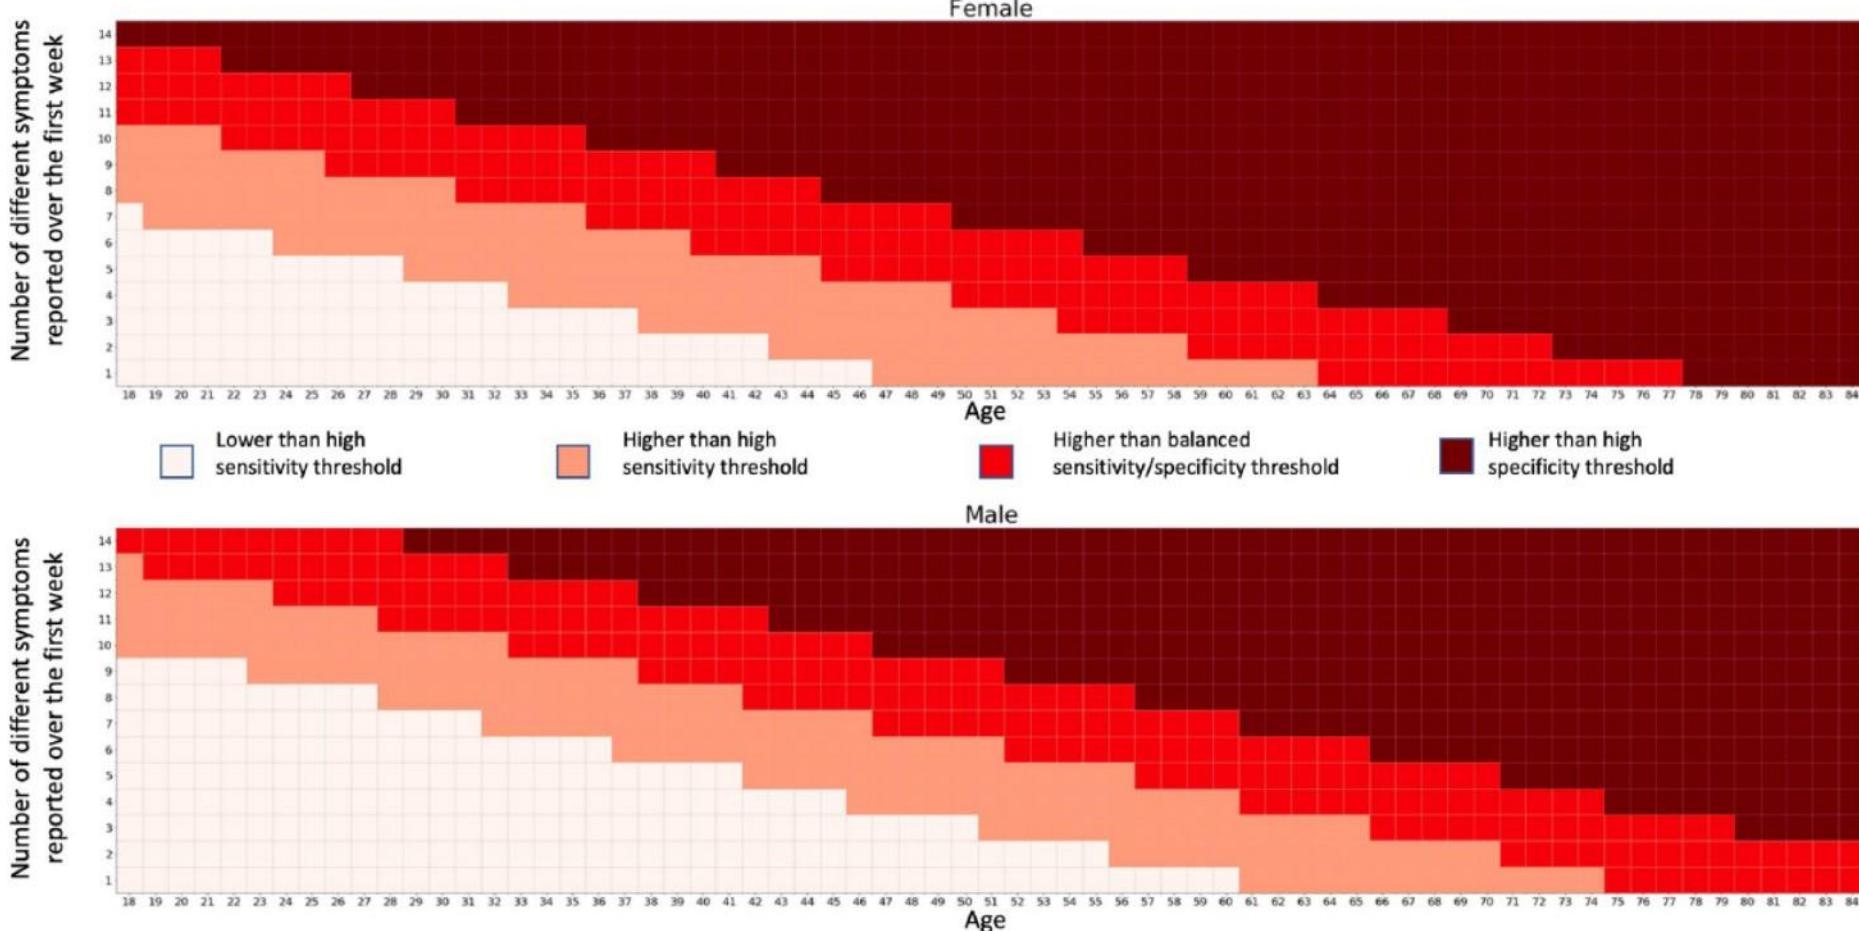

Figure 7 A pictorial demonstration of the various risk factors which when present, make the patients of COVID-19 more susceptible to develop Long-COVID-19.

# Attributes and predictors of long COVID

NATURE MEDICINE | VOL 27 | APRIL 2021 | 626-631 | www.nature.com/naturemedicine

**Extended Data Fig. 8 | Nomograms.** Example of nomograms that could be used to assess risk of developing LC28 based on 7 days of symptoms and corresponding table of sensitivity, specificity positive and negative predictive values at the different thresholds, given a prevalence of 13.3%. For a sensitive model, for example to apply further monitoring for the development of Long-COVID, the threshold between white and pink could be used, with a PPV of 34% and NPV of (98%), whereas more specific model, for example to recruit to trials to prevent Long-COVID, might use the dark red threshold, with a PPV of 60%, although some individuals who would go on to have Long-COVID would not be recruited (NPV 82%). Symptoms considered for the count: Fatigue - Headache - Shortness of breath - Fever - Persistent cough - Sore throat - Hoarse voice - Abdominal pain - Diarrhoea - Delirium - Chest pain - Loss of smell - Skipped meals - Unusual muscle pains.

### **The Current Caseload Demographic**

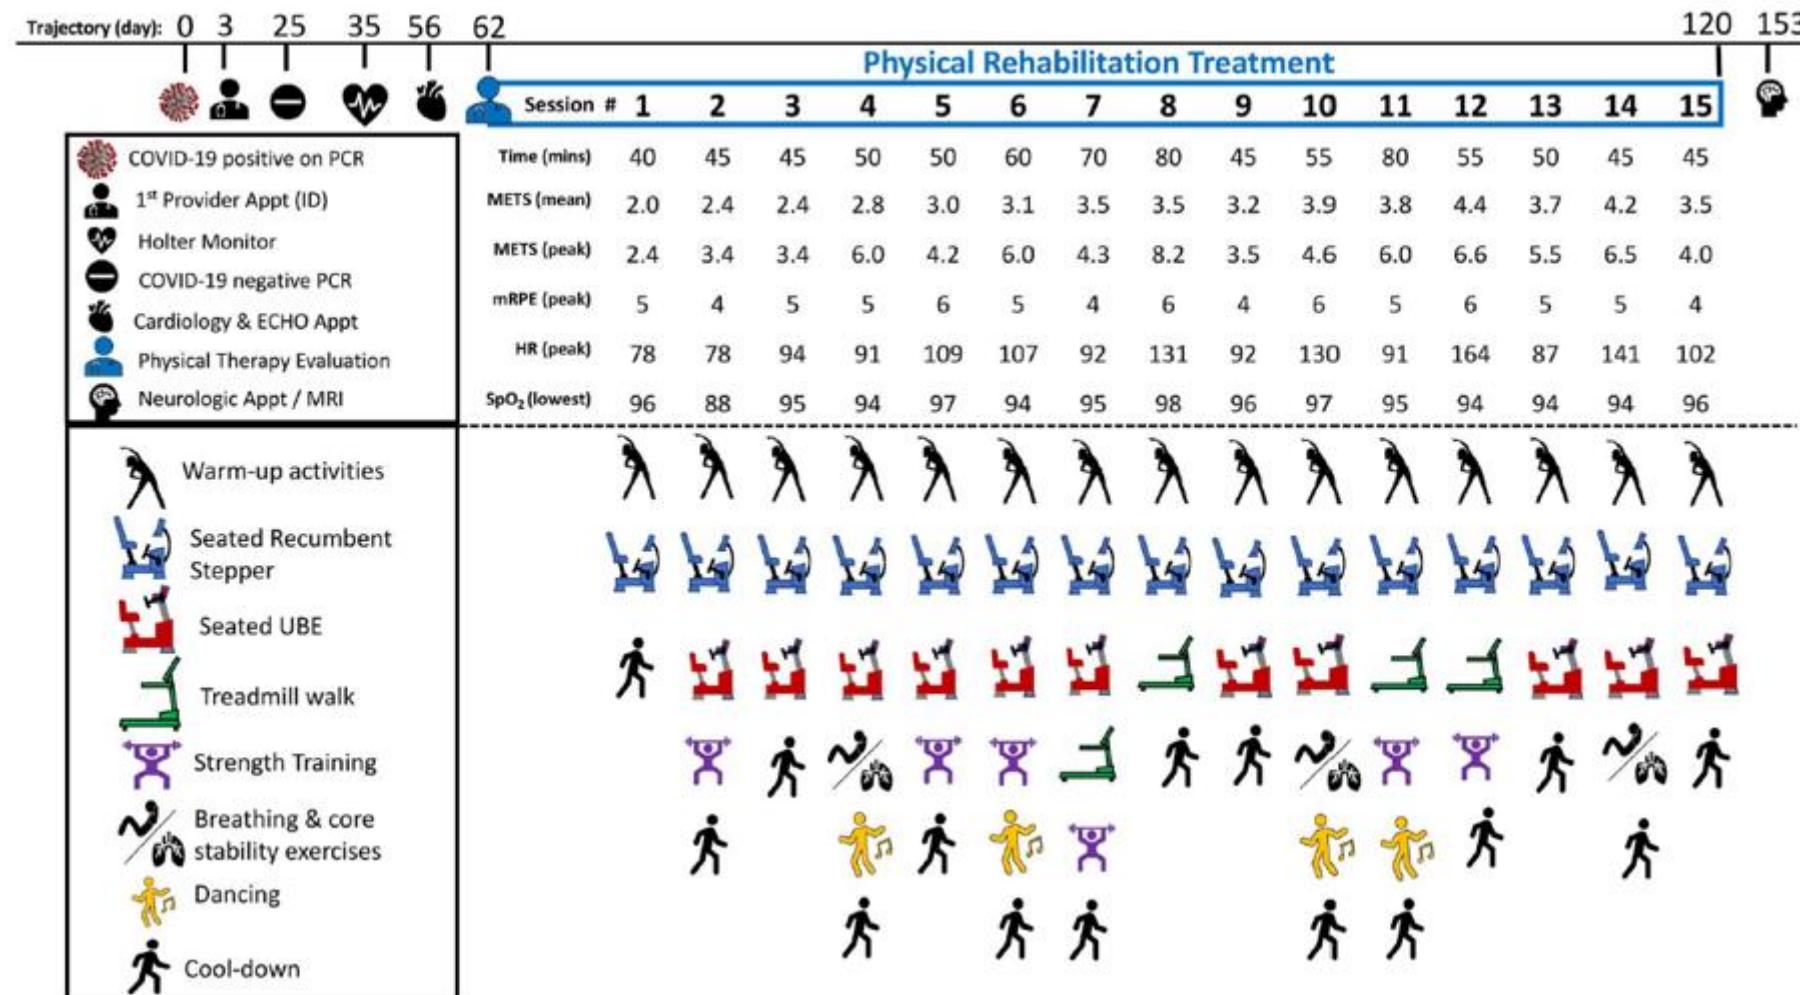

- Young population-with average age of 48 (youngest is 27, oldest is 73)
- Majority of patients are female (68%)
- Majority have not had a hospital admission (74%)
- Many were infected during the first phase of the pandemic (March and April 2020) and continue to have symptoms (82%)
- Unable to work or have had to reduce hours (54%)\*

# Education thérapeutique et SD post-covid = fatigue

**Table 5.** Virtual Fatigue Management Course Modules.

Week	Module	Facilitator	Facilitated discussion questions
1	Overview and understanding fatigue	Occupational therapist and other MDT members	<i>Are you able to recognize when you are becoming fatigued, and how?</i> <i>Can you identify what may trigger your fatigue?</i> <i>What would you like to get out of the programme in order to improve your quality of life and best manage your levels of fatigue?</i>
2	Thinking about activity	Occupational therapist	<i>What activities have people found manageable or more challenging?</i> <i>Have people had experience of using an activity diary? How has this been incorporated into daily routines? How useful have these been?</i>
3	Activity grading	Occupational therapist	<i>How do you ensure you have a combination of activities?</i> <i>Do you know when your stopping point is, or do you tend to only stop when your body tells you to do so?</i>
4	Fatigue and exercise	Physiotherapist	<i>What daily exercise are people managing now?</i> <i>Has anyone tried to return to higher level exercise? How did this affect your fatigue levels and ability to do other activities?</i>
5	Diet and nutrition	Dietician	<i>Have you noticed a pattern between your fatigue and what you eat?</i> <i>Have you altered your diet to try and improve your fatigue? What did you try and did it help?</i>
6	Sleep hygiene	Neuro occupational therapist	<i>What do you find works well to improve your sleep to recover for the next day?</i>
7	Cognition and communication	Neuro occupational therapist	<i>What difficulties are you having with your memory, attention or communication?</i> <i>Can you see any strategies that would be beneficial within your daily routines?</i>
8	Mindfulness	Neuro occupational therapist	<i>Can you see any strategies that would be beneficial within your daily routines?</i>

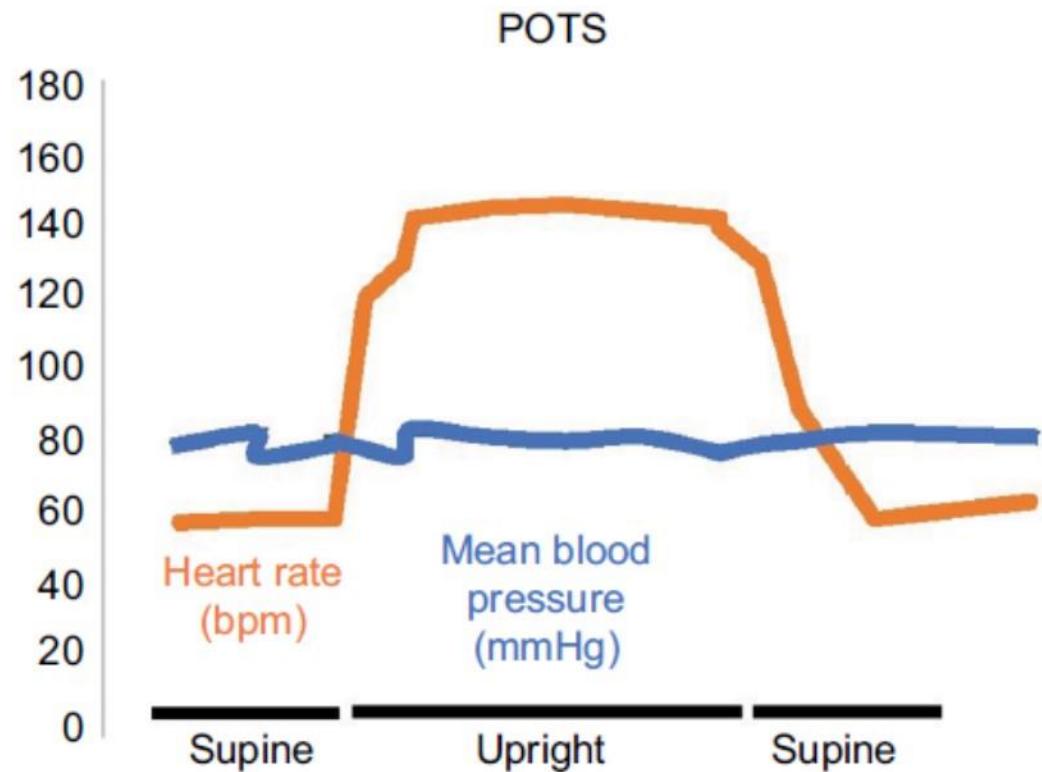

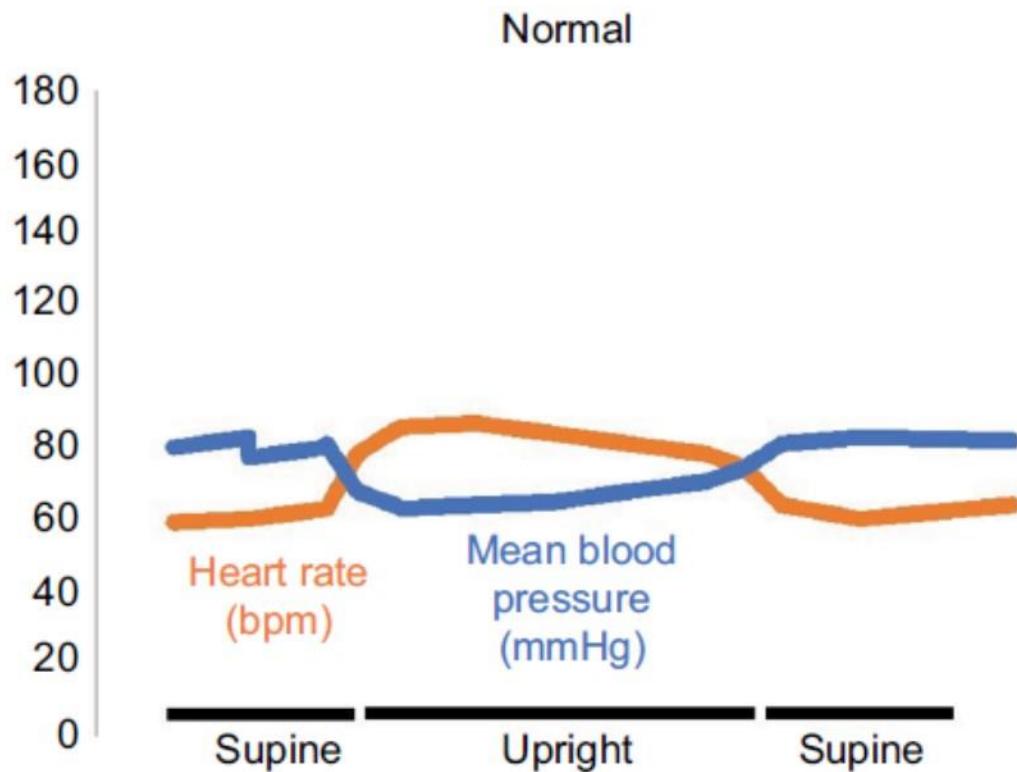

# Physical Therapy Management of an Individual With Post-COVID Syndrome: A Case Report

## POTS et SD post-covid = reconditionnement fractionné

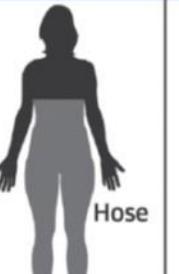

POTS is a multifactorial syndrome rather than a specific disease. It is characterized by all of the following<sup>1,4-6</sup>:

- An increase in heart rate of  $\geq 30$  bpm, or  $\geq 40$  bpm for those under age 19, within 10 minutes of standing from a supine position
- Sustained tachycardia ( $> 30$  seconds)
- Absence of orthostatic hypotension (a fall in blood pressure of  $\geq 20/10$  mm Hg)
- Frequent and chronic duration ( $\geq 6$  months).

**FIGURE 3** POTS and Proposed Subtypes

<b>Avoid Situations That Can Exacerbate Symptoms</b>	<b>Liberal Intake of Salt and Water</b>	<b>Sleep With Head of Bed Elevated</b>
 <b>Large/Heavy Meals</b>  <b>Heat Exposure</b>  <b>Alcohol Intake</b>	 	 <b>Head posts should be elevated 4-6 inches</b>
<b>Use of Compression Garments</b>	<b>Physical Counter Maneuvers</b>	<b>Drinking Water Before Getting Up In The Morning</b>
<b>Strategies to Avoid Upright Exercise</b>		
 <b>Abdominal Binder</b>	 <b>Hose</b>  <b>Leg Crossing Maneuver</b>  <b>Squatting</b>	 <b>Drinking a 16 oz glass of water quickly before getting out of bed in the morning or prolonged standing to minimize orthostatic symptoms</b>
 <b>Seated Rower</b>	 <b>Swimming</b>	 <b>Recumbent Bicycle</b>

# SHV et SD post-covid = évaluations et thérapies

## Evaluations :

- 1) Score de Nijmegen **score > 24/64**
- 2) Test chronométré d'une tenue d' une apnée  
**nle 30-60 sec, SHV = 10-12 sec**
- 3) Test de provocation d'une hyperventilation  
**PetCO<sub>2</sub>, VO<sub>2max</sub>...**
- 4) Inter-relations POTS et SHV

## Thérapies :

### Education thérapeutique

- 1) Expliquer, rassurer le patient
- 2) Insister sur l'absence de gravité et de conséquences du SHV

- Eviter les excitants Café, Thé...
- Eviter les boissons gazeuses
- Eviter les ceintures et soutien-gorge serrés
- Sommeil équilibré
- Relaxation, Yoga
- Eventuellement prise en charge psychologique

### Rééducation

- 1) **Prise de conscience respiration thoracique vs respiration abdominale**
  - Respiration «Carrée» TI 4s, apnée 4s, TE 4s ,
  - Travail des apnées apnée 4s
  - ~~-Respiration dans sac plastique (cas + sévères !) biofeedback petCO<sub>2</sub>~~
- 2) **Travail de la ↘ fréquence sans augmentation du VT**
  - Travail sur le rythme (escaliers, métronome)
  - Relâchement au niveau du thorax haut

Duration between hospital discharge and	NA	18 (5–40)

# Description du programme de réadaptation et SD post-covid

TABLE 1 Description of the standardised pulmonary rehabilitation programme in coronavirus disease 2019 (COVID-19)

<b>Diagnostics and medical treatment</b>	Initial physical check-up including body plethysmography, electrocardiography, cardiac ultrasound, blood sampling Continuous adaptation of drug treatment Initiation and adjusting of long-term oxygen therapy, if necessary If necessary, patients received a high-resolution chest computed tomography, sleep lab diagnostics or an online consultation with a neurologist
<b>Endurance training</b>	Cycle endurance training was performed for 10–20 min per session at 60–70% of peak work rate 5 days per week
<b>Strength training</b>	Strength training was performed using resistance training machines The following exercises were performed: leg press, knee extension, pull-down and push-down If possible, the following additional exercises were applied: butterfly forward/backward, rowing, back extension and abdominal trainer Patients performed three sets per exercise at an individual intensity to reach momentary muscular failure after 15–20 repetitions Resistance training usually took ~30 min per session and was applied 5 days per week
<b>Patient education</b>	Patients visited two educational sessions per week about COVID-19 as well as on general topics such as physical activity, oxygen therapy and smoking cessation
<b>Respiratory physiotherapy</b>	Individually tailored chest physiotherapy using various techniques such as breathing retraining, cough techniques, mucus clearance, connective tissue massage, energy conservation techniques, etc. was applied two to four times per week for 30 min each
<b>Activities of daily living training</b>	Activities of daily living training (calisthenics) was applied four to five times per week for 30 min In addition, Nordic walking or aqua fitness were applied twice per week for 30 min
<b>Relaxation techniques</b>	QiGong or progressive muscle relaxation (Jacobson technique) were applied twice per week for 30 min
<b>Occupational therapy</b>	Occupational therapy was used to treat individual neurological issues such as limited motor ability in the hands or insecure gait (if needed) Brain-performance training was performed to improve memory and concentration
<b>Psychological support</b>	A psychologist supported COVID-19 patients individually as well as during group therapy on aspects of disease management and coping with COVID-19 and its sequelae
<b>Nutritional counselling</b>	If necessary, nutritional counselling or nutritional supplements were provided to recover body composition (after body weight loss during hospital stay)

Signs of at least mild anxiety according to GAD-7 score $\geq 5$	10 (38)	10 (38)	0 (0)	1.00
MoCA score	25 (23–28)	28 (25–28)	3 (1–3)	<b>0.038</b>
Cognitive impairment according to MoCA score <26	12 (46)	6 (23)	-6 (-23)	<b>0.005</b>
mMRC score	2 (2–2)	2 (1–2)	0 (-1–0)	<b>0.003</b>
mMRC score $\geq 1$	24 (92)	23 (88)	-1 (-4)	1.00
mMRC score $\geq 2$	20 (77)	14 (54)	-6 (-23)	<b>0.031</b>

# Conclusions

- Covid ‘long’ : prévalence, prédictions
- Soins basé sur les symptômes plus que la physiopathologie
- Multisystémique : physique/psycho/cognitif/métabolique/comorbidités  
= inter-discipline médicale + inter-professionnel de rééducation
- Atteinte fréquente +++ anxiété généralisée, PTSD, sommeil (dispo psy ?)
- Personnalisation, individualisation des évaluations et des thérapies
- Télé-réadaptation ?
- Recherche (clinical trials, histoire naturelle, racial difference, patient non hospit)
